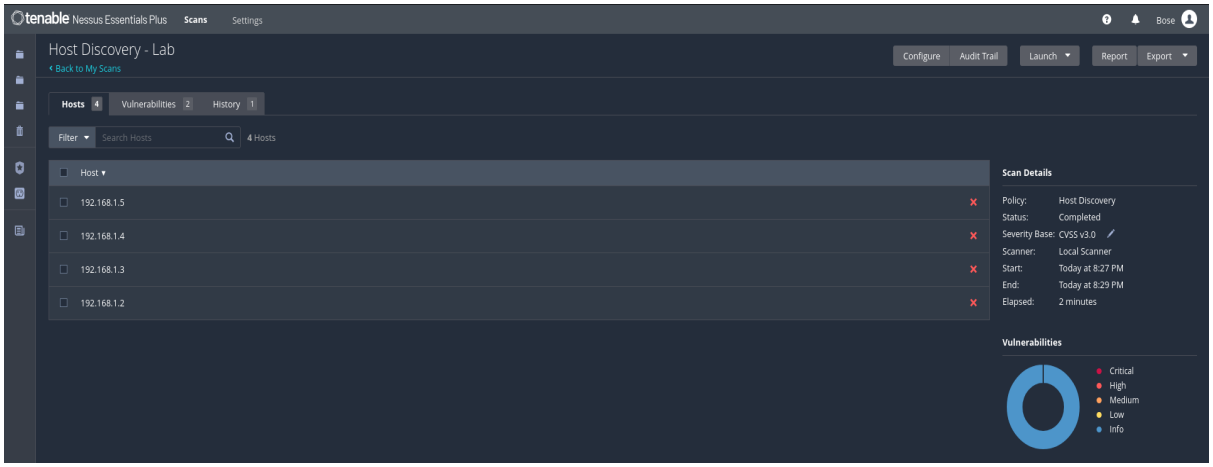
NESSUS VULNERABILITY SCANNER LAB

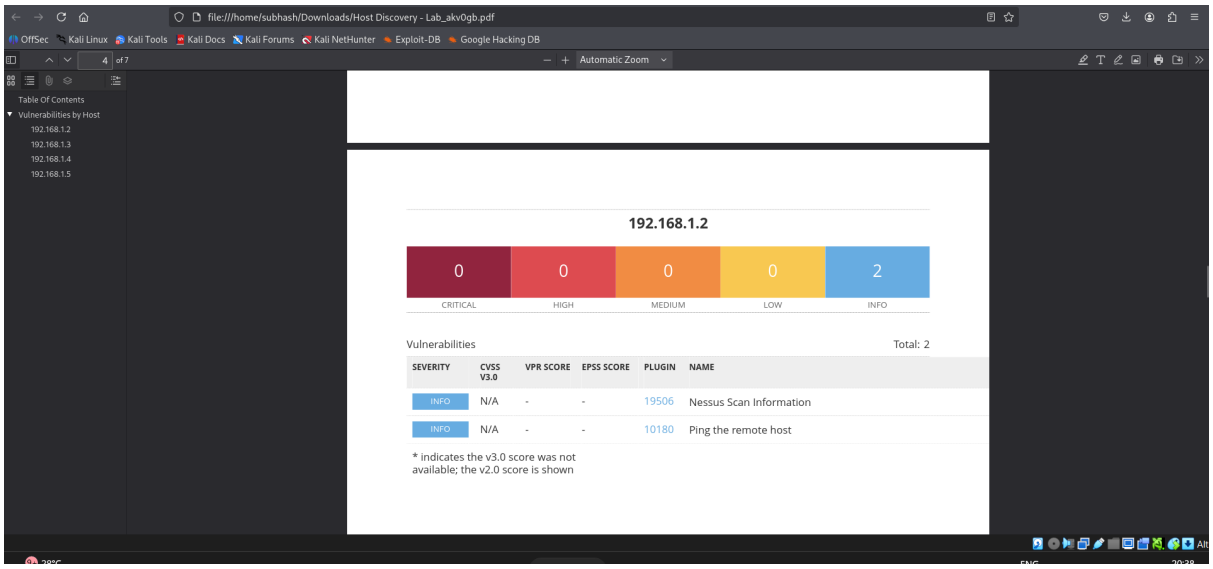
NAME: SUBHASH CHANDRA BOSE

Nessus Host Discovery Scan:

Host Discovery Scan in Nessus is used to identify live and reachable hosts in a network using techniques like ICMP, ARP, and TCP probes, without performing vulnerability assessment.

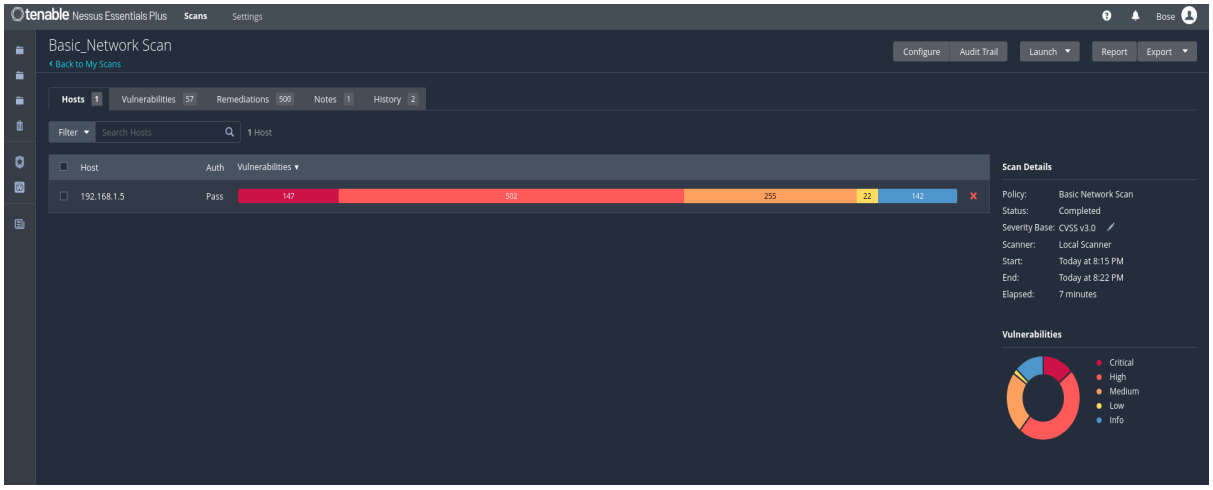


Host Discovery Scan Report:

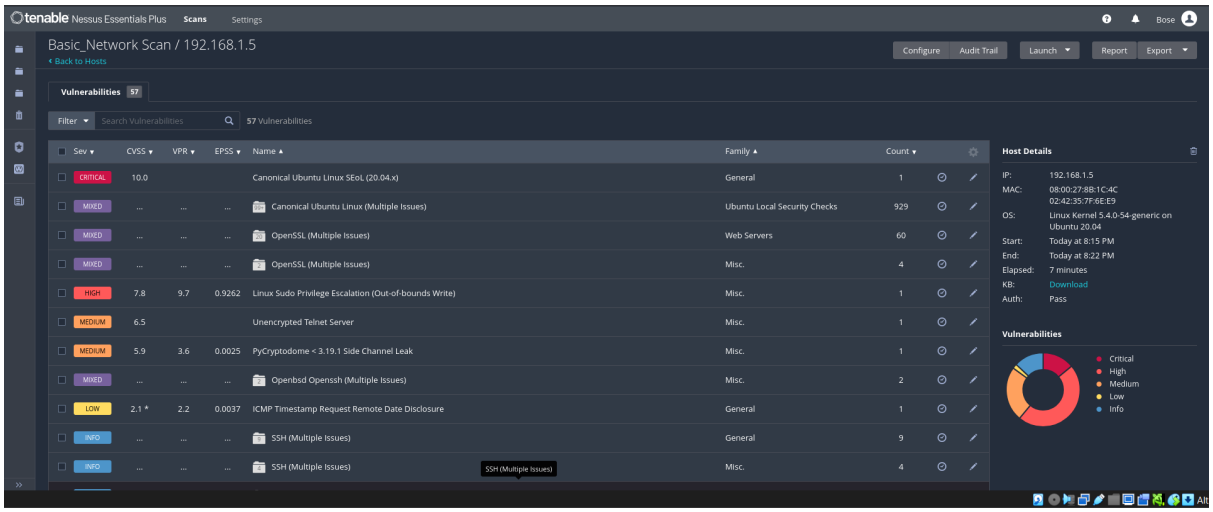


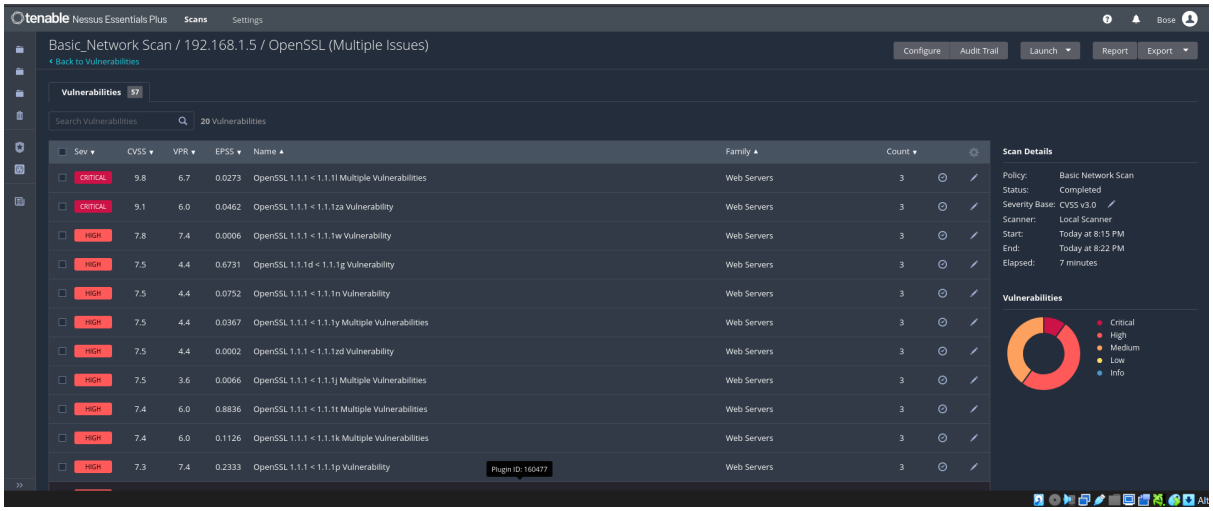
Nessus Basic Network Scan:

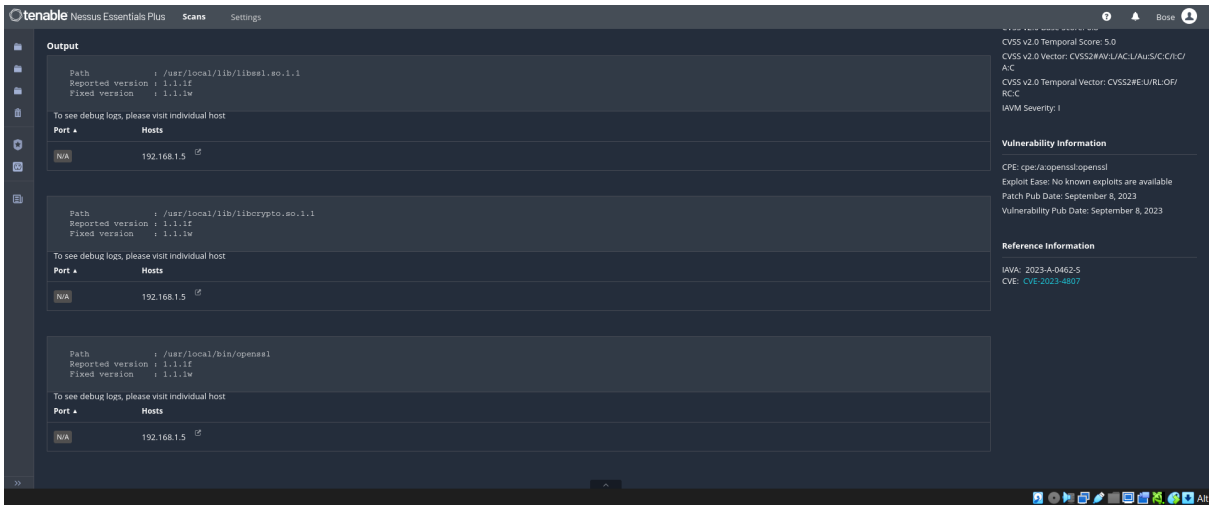
Basic Network Scan is an unauthenticated vulnerability scan that detects open ports, running services, and common network-level vulnerabilities on a target system.



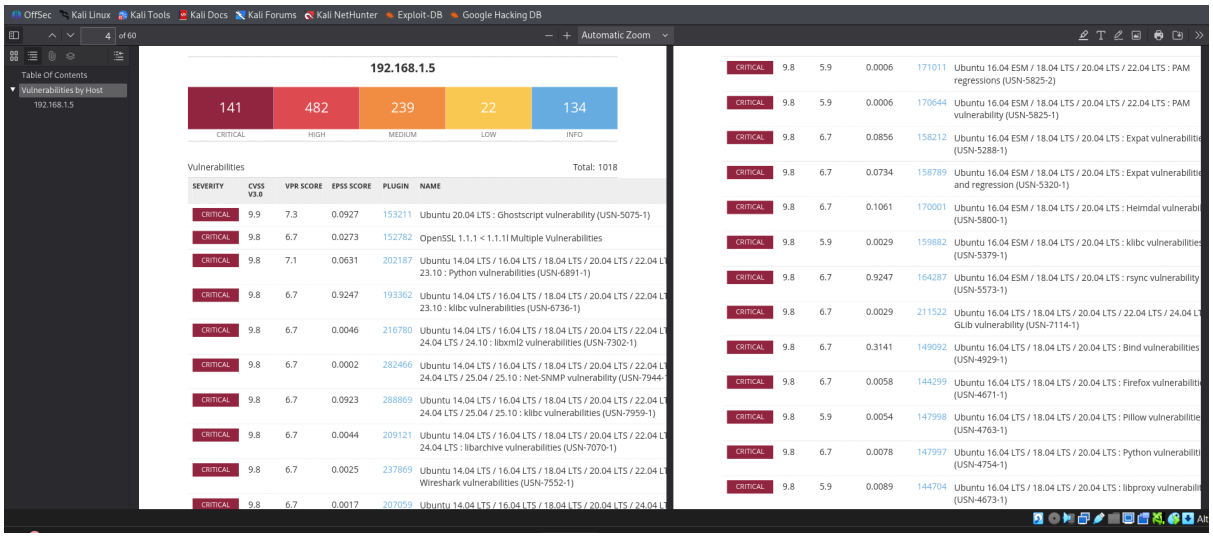
DETAILED VIEW OF RISKS:

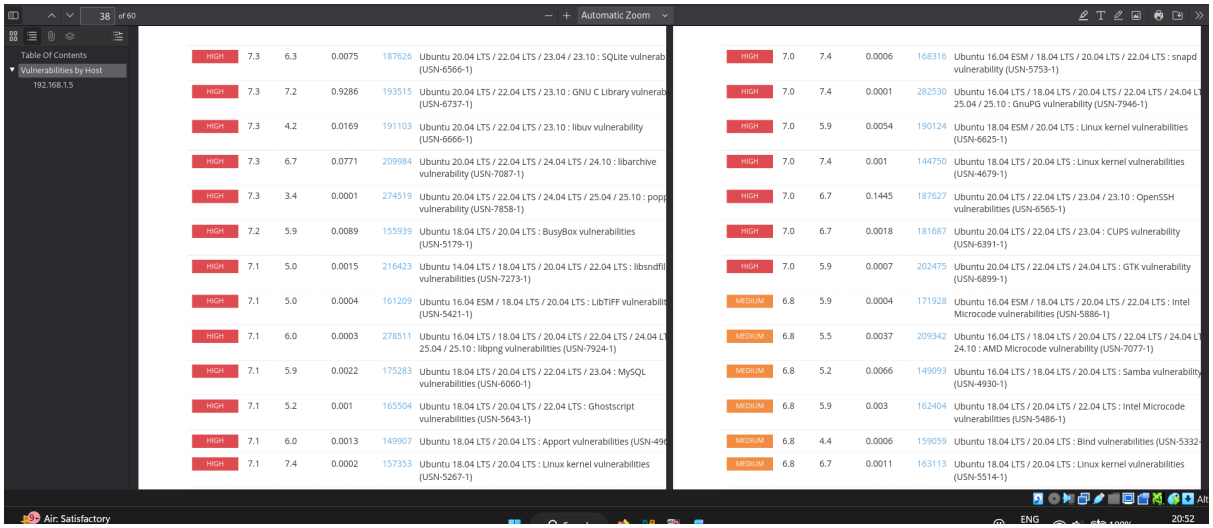






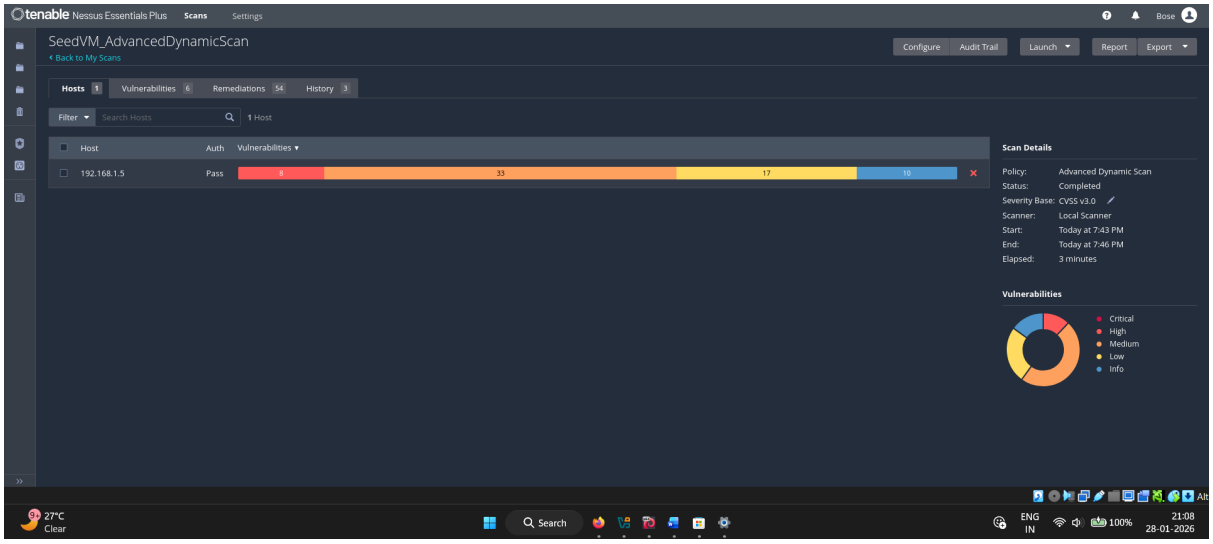
NESSUS Basic Network Scan Report:



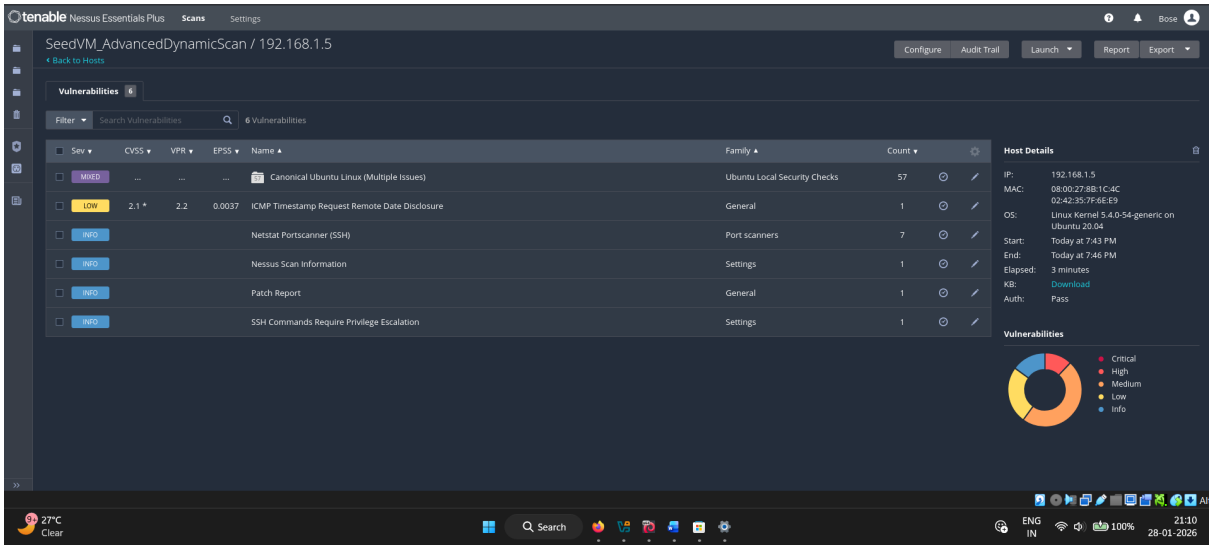


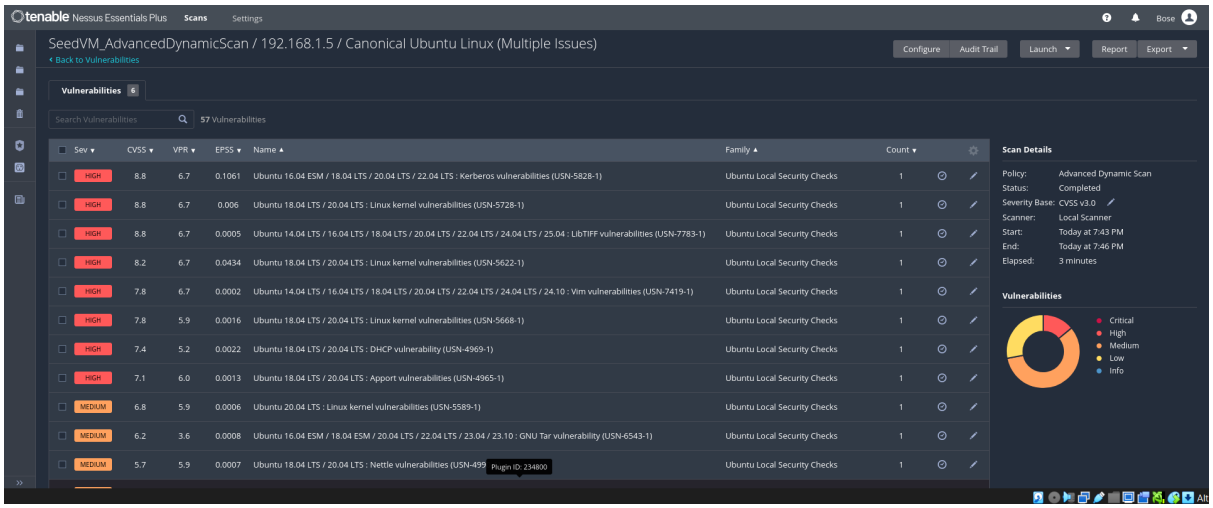
NESSUS ADVANCED DYNAMIC SCAN:

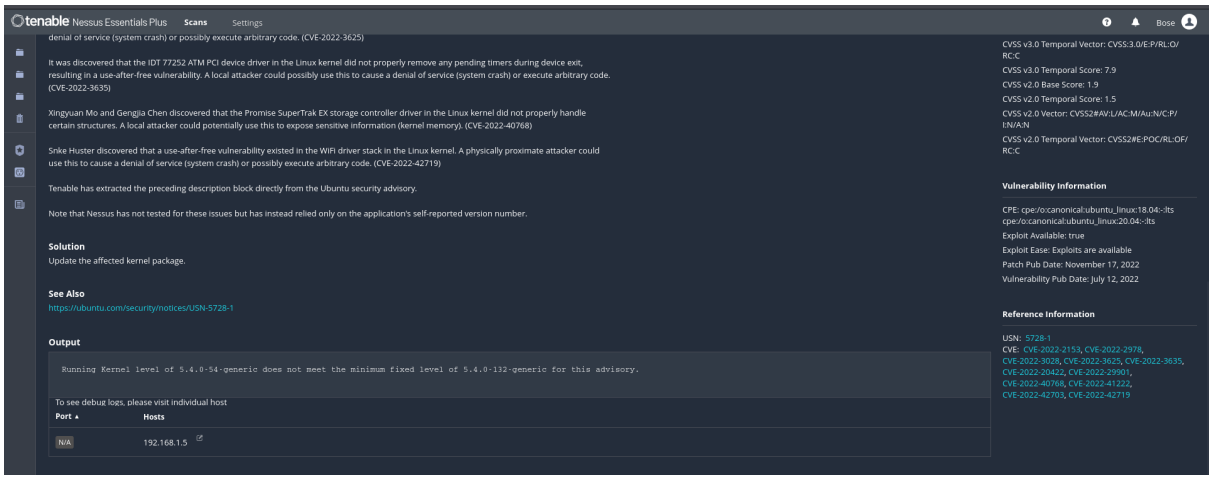
Advanced Dynamic Scan is a flexible Nessus scan that dynamically adapts to discovered hosts, services, and changes during the scan, allowing deeper and adaptive vulnerability assessment.



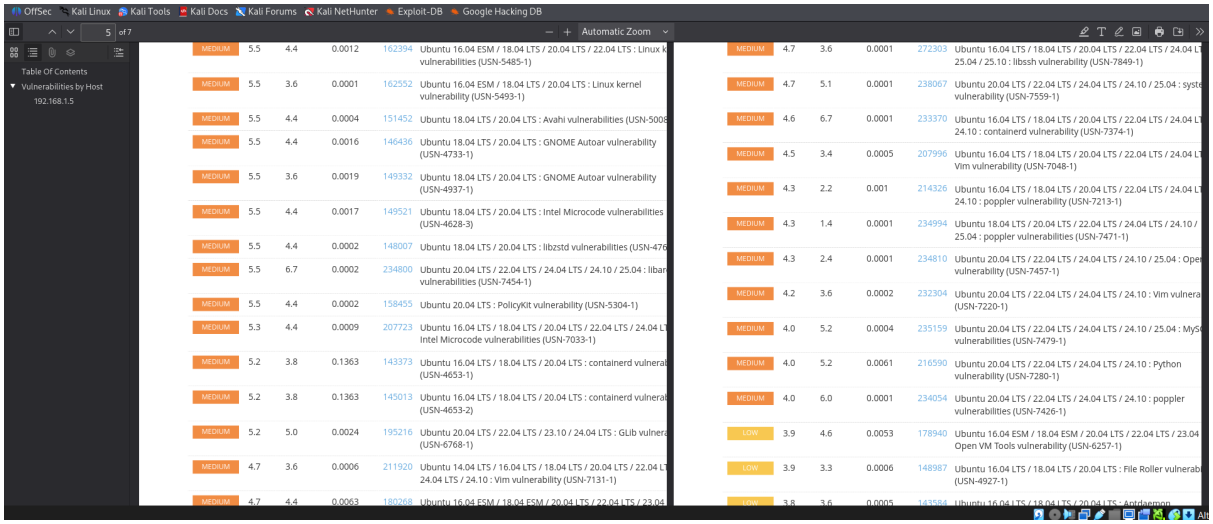
DETAILED VIEW OF RISKS:





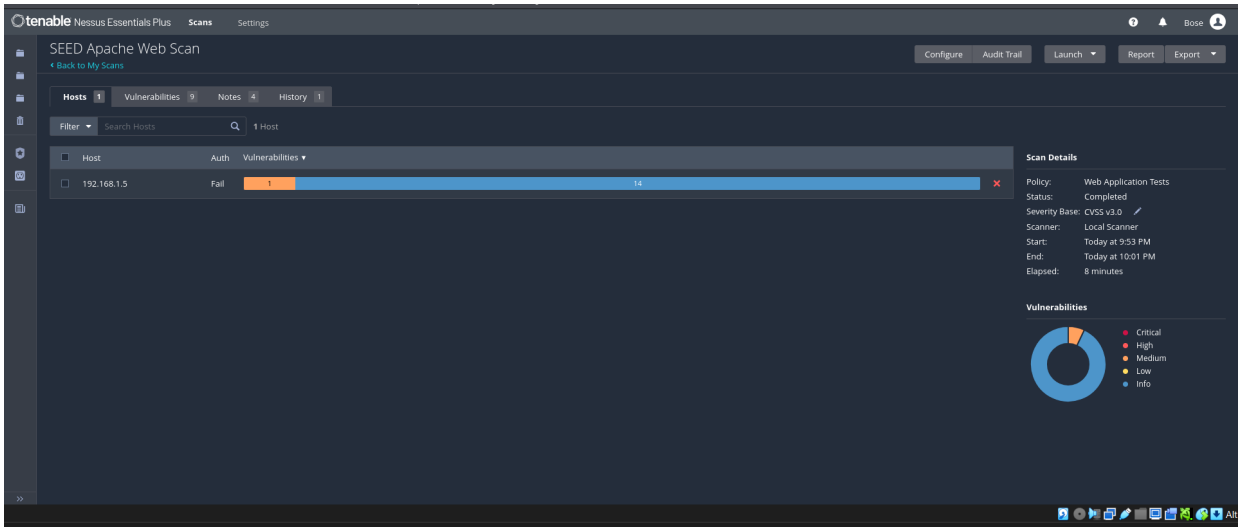


NESSUS ADVANCED DYNAMIC SCAN REPORT:

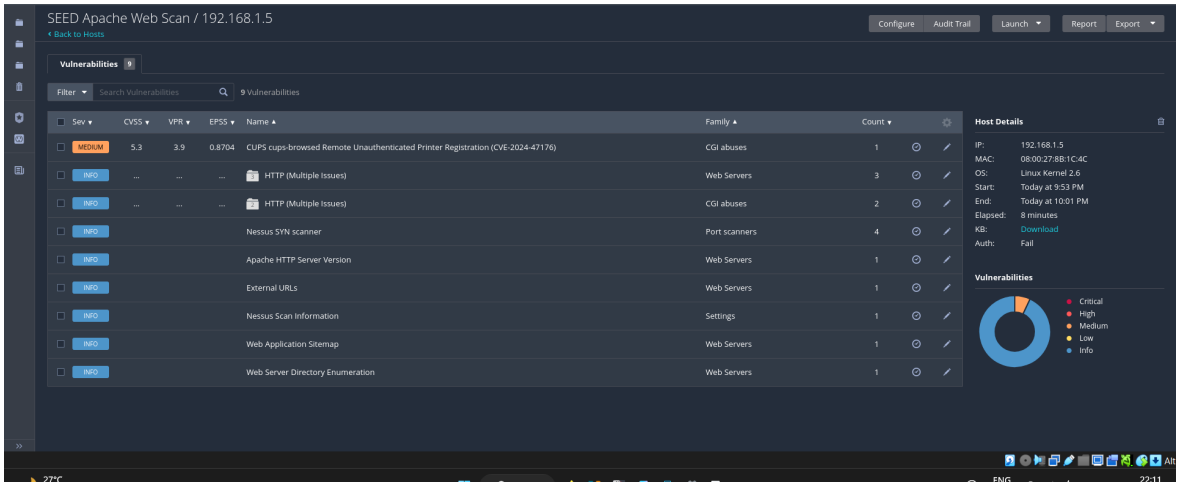


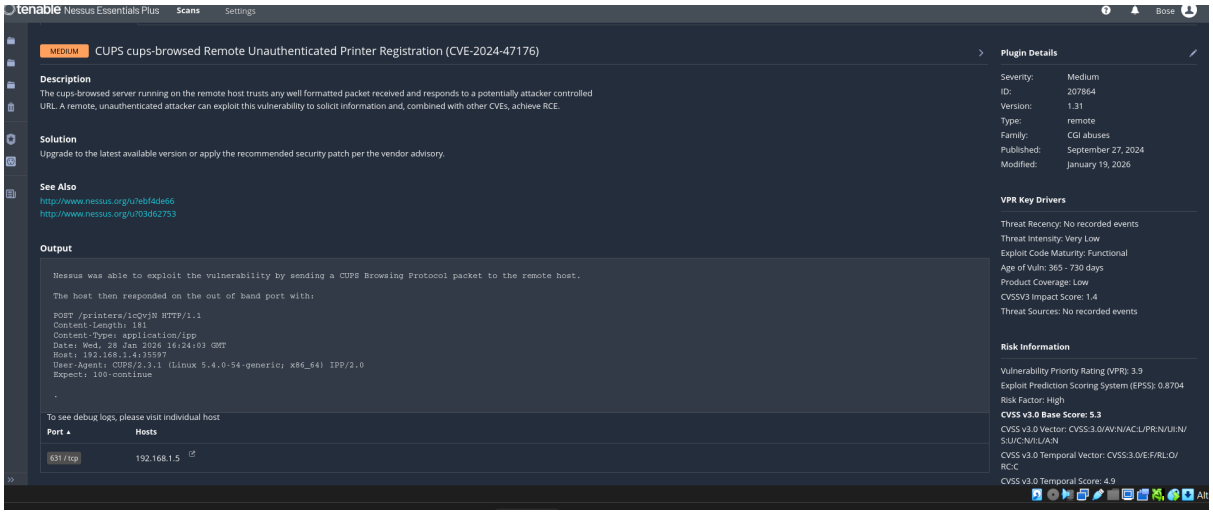
WEB APPLICATION SCAN:

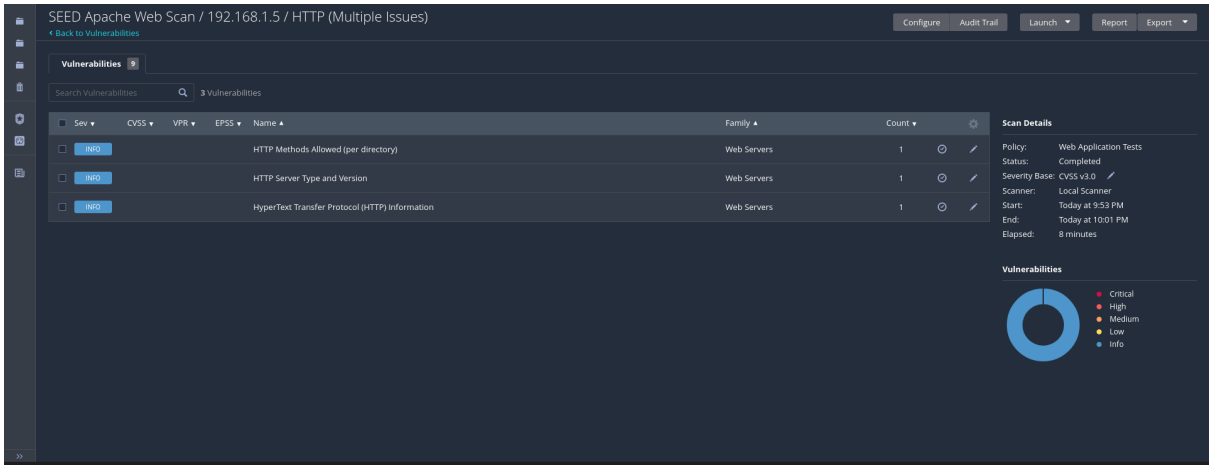
Web Application Scan in Nessus is used to identify vulnerabilities and misconfigurations in web applications by analyzing HTTP/HTTPS responses, URLs, forms, and web server behavior without accessing the underlying operating system.

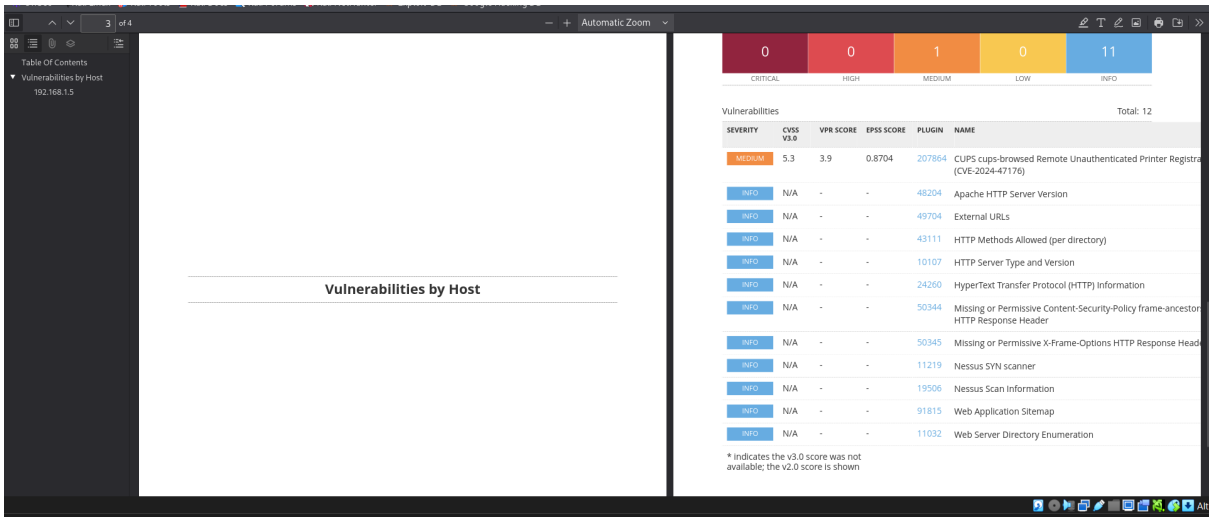


DETAILED VIEW OF RISKS:









WEB APP SCAN REPORT:
